A transformer is a static electrical device that transfers electrical energy between two or more circuits. A varying current in one coil of the transformer produces a varying magnetic flux, which, in turn, induces a varying electromotive force across a second coil wound around the same core. Electrical energy can be transferred between the two coils, without a metallic connection between the ...

History. Breguet recommended the use of reduced-section conductors to protect telegraph stations from lightning strikes; by melting, the smaller wires would protect apparatus and wiring inside the building. A variety of wire or foil fusible elements were in use to protect telegraph cables and lighting installations as early as 1864. A fuse was patented by Thomas Edison in 1890 as part of his ...

$V_{in}(\text{nom})$  – Nominal Input Voltage. We'll take this as 12V. So,  $V_{in}(\text{nom}) = 12$ .;  $f$  – The operating switching frequency in Hertz. Since our switching frequency is 50kHz,  $f = 50000$ .  $B_{max}$  – Maximum flux density in Gauss. If you're used to using Tesla or milliTesla (T or mT) for flux density, just remember that  $1T = 10^4$  Gauss.  $B_{max}$  really depends on the design and the transformer cores ...
